

SUMMARY

Backend developer specializing in Python and Django REST Framework, focused on building scalable, well-architected APIs. Grew a self-driven project portfolio from first API experiments into SalesFlow, a production-style multi-tenant CRM backend with RBAC and complex relational design. Proficient in leveraging AI tools throughout the design and implementation process to plan architecture, write and review code, and accelerate development without compromising quality. Currently completing a B.Sc. in Computer Engineering while continuing to deepen backend engineering skills through hands-on, production-style work.

TECHNICAL SKILLS

Languages: Python

Frameworks: Django, Django REST Framework

Databases: PostgreSQL

DevOps & Tools: Docker, Docker Compose, Git, GitHub Actions (CI)

Auth & Docs: JWT Authentication, Swagger / DRF-YASG

Concepts: Service-Layer Architecture, Multi-Tenant Design, RBAC, RESTful API Design

Async / Queue: Celery, Gunicorn

PROJECTS

Blog Platform API

github.com/parsabarari/blog-drf-cbv-maktabkhooneh-advance

Built as an exercise project for a Django course — the first project where I built a REST API from scratch (using Django REST Framework alongside Django templates) and was introduced to a wide set of backend tooling.

- First hands-on exposure to JWT authentication, Celery, Redis, Nginx, Gunicorn, Git/GitHub workflows, and API documentation with drf-yasg — put into use for the first time while still learning what each piece did
- Configured separate Docker Compose setups for development, staging, and production environments with Nginx
- Set up a continuous integration workflow using GitHub Actions

Python, Django, JWT, Celery, Redis, Docker, Nginx, Gunicorn, Git

DRF E-Commerce API

github.com/parsabarari/Drf-ECommerce-API

A production-style e-commerce REST API — the project where the tools first touched in the blog project turned into real, working knowledge.

- Became proficient with Docker & Docker Compose, JWT authentication, and Git version control through repeated, deliberate use
- Designed a more complex relational database and used PostgreSQL in a containerized setup for the first time
- Started applying a service-layer architecture to keep business logic (checkout, payment verification, stock updates) out of views and serializers
- Built out the full feature set: product catalog, cart, wishlist, coupons, checkout, and order management, documented with Swagger (DRF-YASG)

Python, Django, DRF, PostgreSQL, Docker, JWT, Swagger/DRF-YASG, Git

SalesFlow — Multi-Tenant CRM SaaS Backend **IN PROGRESS**

A production-grade CRM backend, started to deepen the skills already gained (Celery, Redis, service-layer design) and to push into territory not yet explored: multi-tenancy, RBAC, and more complex database design.

- Designing a significantly more complex database schema alongside a genuinely multi-tenant architecture, with organization-level data isolation enforced at the ORM manager level (fail-closed by default)
- Learning and applying role-based access control (RBAC) for the first time, with 6 permission tiers and team-based visibility rules
- Deepening earlier Celery/Redis experience: JWT authentication with Redis-backed refresh-token blocklisting, and an invitation-based onboarding flow with a scheduled expiry sweep via Celery Beat
- Building lead management, a sales pipeline with a stage-transition state machine, and automatic lead-to-customer conversion on deal closure
- Planned: integrating AI-based systems (e.g., RAG) into the platform as a next step

Python, Django, DRF, PostgreSQL, Redis, Celery, Docker

EDUCATION

B.Sc. in Computer Engineering

In Progress

Islamic Azad University, Qazvin Branch (QIAU) — Iran
