

SUMMARY

Backend-focused developer specializing in building scalable, production-style REST APIs with Python and Django REST Framework. Comfortable designing clean, service-layer architectures that keep business logic organized and maintainable rather than bloating views and serializers. Hands-on experience with authentication, order & payment workflows, multi-tenant systems, Docker-based environments, and API documentation. Currently completing a B.Sc. in Computer Engineering while continuously deepening backend engineering skills through self-driven, production-style projects.

TECHNICAL SKILLS

Languages: Python

Frameworks: Django, Django REST Framework

Databases: PostgreSQL

DevOps & Tools: Docker, Docker Compose, Git, GitHub Actions (CI)

Auth & Docs: JWT Authentication, Swagger / DRF-YASG

Concepts: Service-Layer Architecture, Multi-Tenant Design, RBAC, RESTful API Design

Async / Queue: Celery, Gunicorn

PROJECTS

DRF E-Commerce API

github.com/parsabarari/Drf-ECommerce-API

A production-style e-commerce REST API built with Django REST Framework.

- Implemented JWT authentication, user registration/activation, product catalog, categories, reviews & ratings, shopping cart, and wishlist
- Built a full checkout system with coupon validation, payment workflow, and order management
- Designed a service-layer architecture to separate business logic (checkout, payment verification, stock updates) from views and serializers, avoiding fat serializers
- Documented endpoints with Swagger (DRF-YASG) and containerized the full stack with Docker & docker-compose

Python, Django, DRF, PostgreSQL, Docker, JWT, Swagger/DRF-YASG

SalesFlow — Multi-Tenant CRM SaaS Backend **IN PROGRESS**

A production-grade, multi-tenant CRM backend built solo with Django REST Framework, developed against a fully documented product/business-rules specification and an incremental, phase-based roadmap.

- Designed strict multi-tenant data isolation enforced at the ORM manager level (fail-closed by default), with role-based access control across 6 permission tiers and team-based visibility rules
- Built JWT authentication with Redis-backed refresh-token blocklisting, email verification, password reset, and an invitation-based onboarding flow with a scheduled expiry sweep via Celery Beat
- Implemented lead management and a sales pipeline with a stage-transition state machine, duplicate-lead detection, and an audited lead timeline
- Built customer management with automatic lead-to-customer conversion/matching on deal closure, including conflict handling for ambiguous matches, plus Idempotency-Key support for safe retries on critical write endpoints
- Currently extending the system with support ticketing, activity tracking, and comments/collaboration modules

Python, Django, DRF, PostgreSQL, Redis, Celery, Docker

Blog Platform API

github.com/parsabarari/blog-drf-cbv-maktabkhooneh-advance

Blog platform built with Django class-based views, developed incrementally through an advanced Django training course.

- Configured separate Docker Compose setups for development, staging, and production environments with Nginx
- Set up a continuous integration workflow using GitHub Actions

Python, Django, Docker, Nginx

EDUCATION

B.Sc. in Computer Engineering

In Progress

Islamic Azad University, Qazvin Branch (QIAU) — Iran
